Assignment 18.2 : Problem Statement

In one state, 52% of the voters are Republicans, and 48% are Democrats. In a second state, 47% of the voters are Republicans, and 53% are Democrats. Suppose a simple random sample of 100 voters are surveyed from each state.
What is the probability that the survey will show a greater percentage of Republican voters in the second state than in the first state?

Solution

For this analysis,

Let P_1 = the proportion of Republican voters in the first state

P_2 = the proportion of Republican voters in the second state

p_1 = the proportion of Republican voters in the sample from the first state

p_2 = the proportion of Republican voters in the sample from the second state.

The number of voters sampled from the first state (n_1) = 100,

and The number of voters sampled from the second state (n_2) = 100.

Step 1 : To make sure the sample size is big enough to model differences with a normal population.

Because $n_1P_1 = 100 * 0.52 = 52$,
$n_1(1 - P_1) = 100 * 0.48 = 48$,
$n_2P_2 = 100 * 0.47 = 47$, and
$n_2(1 - P_2) = 100 * 0.53 = 53$

all above values are each greater than 10, the sample size is large enough.

Step 2: Find the mean of the difference in sample proportions:

$\mu_{p1 - p2} = P_1 - P_2 = 0.52 - 0.47 = 0.05$.

Step 4: Find the standard deviation of the difference.

σ_d = sqrt{ [$P_1(1 - P_1) / n_1$] + [$P_2(1 - P_2) / n_2$] }

σ_d = sqrt{ [(0.52)(0.48) / 100] + [(0.47)(0.53) / 100] }

σ_d = sqrt (0.002496 + 0.002491) = sqrt(0.004987) = 0.0706

Step 3: Find the probability.

This problem requires us to find the probability that p_1 is less than p_2. This is equivalent to finding the probability that $p_1 - p_2$ is less than zero. To find this probability, we need to transform the random variable ($p_1 - p_2$) into a z-score.

That transformation appears below :

$z_{p1 - p2} = (x - \mu_{p1 - p2}) / \sigma_d = = (0 - 0.05)/0.0706 = -0.7082 = -0.71$ (upto 2 decimals)

Using Table for Standard Normal Distribution, we find

Table of Standard Normal Probabilities, P(Z < z)

$P(z <= 0.7082) = 0.2389 = 0.24$ (upto 2 decimals)

the probability of a z-score being -0.7082 = 0.71 (upto 2 decimals) or less is 0.24

Therefore, the probability that the survey will show a greater percentage of Republican voters in the second state than in the first state is 0.24.
